EXPERIENCE

- SDE 2

Nov. 2025 – Present

UIX Labs — Morphic

- Own major surfaces of Morphic's SvelteKit studio, including the generation canvas, visual workflow editor, collaborative documents, and chat used to create and organize AI-generated film assets.
 - Created Figma-style threaded comments with real-time updates, reply workflows, resolution states, and collaborative discussions attached directly to creative work.
 - Built passwordless authentication with one-time codes and passkeys, then designed the organization model supporting memberships, role-aware permissions, and cross-organization sharing.
 - Shipped billing end to end across plans, seat-aware upgrades, credit limits, and enterprise tiers, connecting product access to subscription and usage state.
 - Engineered durable Temporal workflows for long-running generation pipelines where one render fans out across multiple AI models and must survive retries, delays, and partial failures.
- SDE 1

Feb. 2025 – Nov. 2025

UIX Labs — Air Cargo Management OS

Gurugram, India · Hybrid

- Built a design system from scratch and reusable UI modules used across cargo configuration, inventory management, capacity planning, and operational execution.
 - Implemented frontend role-based access control across routes, actions, and individual fields so one application could support personas from ground staff to network administrators.
 - Engineered schema-validated multi-step forms with conditional branches, cross-step dependencies, server-driven field rules, and step-level error reporting.
 - Shipped dynamic data tables, real-time capacity dashboards, automated route generation, and a configurable validation-rules engine for digitizing air cargo operations.
- Software Developer

Apr. 2024 – Feb. 2025

MindPeers

Delhi, India

- Built a therapist portal for availability and slot management, appointment tracking, and profile customization within a mental-health platform.
 - Reworked caching and data fetching to cut API calls by 65% and reduce load time by 70% across frequently revisited workflows.
 - Led dependency upgrades and code optimization that reduced production build size by 45% and improved initial load time by 30%.
- Software Developer

Feb. 2023 – Apr. 2024

Basil

- Built a real-time ordering system with live tracking, instant notifications, and automated status transitions from checkout through fulfillment.
 - Developed an offline-first point-of-sale system with background synchronization, allowing merchants to operate through network outages with zero data loss.
 - Shipped e-commerce catalog, search, cart, payments, and real-time inventory, plus merchant analytics with configurable visualizations, filters, and automated reports.
- Full Stack Developer Intern

May 2022 – Nov. 2022

Younglabs

- Led frontend delivery for a high-traffic application, reworking user flows and performance while building dashboards and interactive landing pages.
 - Introduced a reusable component design system across projects and integrated backend services with real-time data synchronization.

PROJECTS

- TanStack Hotkeys — Svelte Adapter

2026
- TypeScript, Svelte 5, TanStack*

- Authored the Svelte 5 adapter using runes and lifecycle-safe teardown, so reactive shortcut maps re-register cleanly and every listener detaches when its component unmounts.
 - Matched the React adapter's behavior through the shared cross-adapter test suite while keeping TanStack Hotkeys' core framework-agnostic.
 - Added adapter documentation and tests; merged upstream in [PR #45](#) with approximately 5,600 lines across 129 files.
- BetterNotch

2026 – Present
- Swift 6, SwiftUI, AppKit, macOS*

- Building a native macOS notch utility for music, battery, calendar, timers, files, clipboard, weather, privacy controls, and camera features.
 - Designed every user-facing feature as a toggleable extension; disabled extensions are never instantiated, and activation or teardown happens live without relaunching the app.
 - Built an event-driven architecture around strict budgets of 0.0% collapsed idle CPU, zero idle timers, and under 60 MB memory, with a single shape animating smoothly at 120 Hz.
- Minimal Query

2025
- TypeScript, React*

- Rebuilt React Query's core in approximately 400 lines around four abstractions: QueryClient, QueryCache, Query, and QueryObserver.
 - Implemented stable object-key hashing and request deduplication through one shared in-flight promise per query, preventing duplicate network requests across components.
 - Separated stale-time refetch decisions from garbage-collection timers and implemented observer subscription, unsubscription, and remount behavior.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Swift, SQL
Frameworks: Svelte 5, SvelteKit, React, Next.js, Astro, Tailwind CSS, SwiftUI
Backend & Data: Node.js, Temporal, PostgreSQL, Drizzle, Redis
Developer Tools: Google Cloud, Cloudflare, Vercel, Docker, Git, Vitest, Storybook
